

AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions and listings of claims in the application:

LISTING OF CLAIMS:

1. (currently amended): Radiographic equipment comprising:

a first neutron source of substantially mono-energetic fast neutrons produced via the deuterium-tritium or deuterium-deuterium fusion reactions, comprising a sealed-tube ~~or similar~~ generator for producing the neutrons;

a separate source of X-rays or gamma-rays of sufficient energy to substantially penetrate an object to be imaged;

a collimating block surrounding the neutron source and the X-ray ~~and or~~ gamma-ray ~~source~~source, ~~apart from the provision of~~ and comprising one or more slots for emitting substantially fan-shaped radiation beams;

a detector array comprising a multiplicity of individual scintillator pixels to receive neutron radiation energy and X-ray or gamma-ray radiation emitted from the respective sources and to convert the received ~~energy radiation~~ into light pulses, the detector array aligned with the fan-shaped radiation beams emitted from the source collimator and collimated to substantially prevent radiation other than that directly transmitted from each of the sources from reaching the array;

~~conversion means~~ converter for converting the light pulses produced in the scintillators into electrical signals;

~~conveying means~~conveyor for conveying the object between each of the sources and the detector array;

~~computing means~~computing device for determining from the electrical signals the attenuation of the neutrons and the X-ray or gamma-ray beams and to generate output representing the mass distribution and composition of the object interposed between each of the sources and detector array; and

~~display means~~display for displaying images based on the mass distribution and the composition of the object being scanned.

2. (currently amended): Radiographic equipment according to claim 1, where the X-ray or gamma-ray source comprises a ~~137Cs~~¹³⁷Cs, ~~60Co~~⁶⁰Co or similar radioisotope source having an energy of substantially 1 MeV.

3. (previously presented): Radiographic equipment according to claim 1, where the X-ray or gamma-ray source comprises an X-ray tube or electron accelerator producing X-rays through Bremsstrahlung on a target.

4. (currently amended): Radiographic equipment according to claim 1, where the neutron source produces neutrons having substantially higher energies than the X-ray or gamma-rays from the X-ray or gamma-ray source, where the neutron and X-ray or gamma-ray sources are arranged to pass through the same slot in the collimating block and a single detector array is

used, comprising individual pixels of plastic or liquid organic scintillator, where discrimination between the X-rays or gamma-rays and the neutrons is made on the basis of the energy they deposit in the scintillator.

5. (previously presented): Radiographic equipment according to claim 1, where the sources of neutrons and X-ray or gamma-rays are arranged to pass through the same slot in the collimating block and a single detector array is used comprising individual pixels of plastic or liquid organic scintillator, where the neutron and X-ray or gamma-ray sources are operated alternately.

6. (previously presented): Radiographic equipment according to claim 1, where the sources of neutrons and X-ray or gamma-rays are arranged to pass through separate parallel slots in the collimator block and two detector arrays are used, one comprising individual pixels of plastic or liquid organic scintillator for the detector of the neutrons and one comprising individual pixels of plastic, liquid or inorganic scintillator for detection of the X-rays or gamma-rays.

7. (previously presented): Radiographic equipment according to claim 4, where each slot of the source and detector collimators are sufficiently wide to ensure full illumination of the detectors by the source, whilst minimising the detection of scattered radiation.

8. (currently amended): Radiographic equipment according to claim 1, further comprising a second sealed tube or similar neutron generator for source—producing neutrons via either the

deuterium-tritium or deuterium-deuterium fusion reactions, where the second source of neutrons uses ~~the~~ a complementary fusion reaction to the first neutron source.

9. (previously presented): Radiographic equipment according to claim 8, where the neutrons from the second neutron source are detected in a separate collimated detector array comprising individual pixels of plastic or liquid organic scintillator.

10. (currently amended): Radiographic equipment according to claim 9, where one of the first neutron source or the second neutron source ~~of neutrons~~ has an energy of substantially 14 MeV and the other ~~source of neutrons~~ has an energy of substantially 2.45 MeV.

11. (currently amended): Radiographic equipment according to claim 1, where the ~~conversion~~ means convertor comprises a plurality of photodiodes, wherein the scintillator material is selectable to have an emission wavelength substantially matched to the response of the photodiodes.

12. (currently amended): Radiographic equipment according to claim 1, where the ~~conversion~~ means convertor comprises crossed wavelength shifting fibres coupled to a multiplicity of single or multi-anode photomultiplier tubes.

13. (currently amended): Radiographic equipment according to claim 11 , where the electrical signals from the ~~conversion means~~converter ~~are used to infer~~indicate the transmission of the ~~neutrons from the first~~ neutron source and the X-rays or gamma-rays through the object being scanned, or the transmission of the neutrons from the first neutron source, the X-rays or gamma-rays and the neutrons from ~~the~~a second neutron source through the object being scanned.

14. (currently amended): Radiographic equipment according to claim 13, where ~~the transmissions are used to compute~~ mass attenuation coefficient images for each pixel are computed based on the respective transmissions and displayed ~~for display~~ with different pixel values mapped to different colours, where the image ~~based on~~is indicative of the mass distribution and composition inferred from ~~these~~the computations.

15. (currently amended): Radiographic equipment according to claim 1, where the ~~computing means~~computing device comprises a computer to perform image processing and display the images on a computer screen.

16. (previously presented): Radiographic equipment according to claim 15, where the output is convertible to mass-attenuation coefficient images for each pixel for display on a computer screen with different pixel values mapped to different colours.

17. (previously presented): Radiographic equipment according to claim 16, where the mass-attenuation coefficient images are obtainable from count rates measured from the transmissions for each of the deuterium-tritium neutrons or deuterium-deuterium neutrons and X- rays or gamma-rays, or the deuterium-tritium neutrons, deuterium-deuterium neutrons and X- rays or gamma-rays.

18. (previously presented): Radiographic equipment according to claim 17, where the computer is operable to obtain cross section ratio images between pairs of mass attenuation coefficient images.

19. (previously presented): Radiographic equipment according to claim 18, where the proportions in which the cross section ratio images are combined are adjustable to maximise contrast and sensitivity to a particular object being examined in the image.

20. (previously presented): Radiographic equipment according to claim 18 , where the computer is able to perform automatic material identification based on the measured cross sections.

21. (previously presented): Radiographic equipment according to claim 19, where the proportions in which the cross section ratio images are combined are operator adjustable.

22. (currently amended): Radiographic equipment according to claim 1, where the sources and the detector array are stationary and the ~~transport mechanism~~conveyor is arranged such that the object is able to be moved in front of the source of neutrons.

23. (currently amended): Radiographic equipment according to claim 1, where the object is stationary and the ~~transport mechanism~~conveyor is arranged such that the source and the detector array move in synchronicity on either side of the object.

24. (canceled).

25. (previously presented): Radiographic equipment according to claim 1, where multiple views are obtained by either rotating the object relative to the sources and the detector array or by rotating the sources and the detector array relative to the object.

26. (currently amended): Radiographic equipment according to claim 1, where the intensity of ~~either the deuterium-deuterium and/or deuterium-tritium neutron~~the first neutron source sources is of the order ~~10¹⁰~~10¹⁰ neutrons/second or ~~greater as high as practically possible~~.

27. (previously presented): Radiographic equipment according to claim 11 where the scintillators are surrounded by a mask to cover at least a portion of each of the scintillators, each mask having a first reflective surface to reflect escaped light pulses back into the scintillator.

AMENDMENTS TO THE DRAWINGS

Applicant herewith submits four (4) new sheets and sixteen (16) Replacement Sheets in order to address issues raised by the Examiner in the June 8, 2006 Office Action. No new matter has been added.
